

# What is the SuperControl API and how do I enable it?

The API is a sophisticated feed that allows you to offer a more customised way of displaying your property information from SuperControl on your website.

Build a search form using region and property type, create your own search results or build a property information page where all information is pulled from SuperControl. It could feature prices, photos, maps, testimonials, descriptions, location information, custom search amenities and additional custom fields.

## How much does it cost to use the API?

The SuperControl API costs from £300 + VAT per year.

Building a website using the API will require a much greater level of input from your developer than just popping on the availability calendar widget. We would recommend that you discuss whether you require the API with your web developer.

If you would like to enable the SuperControl API, please [contact our support team](#).
